Recent developments in the design of implant shape and implant micro-surface seem to allow considerably shorter healing times. In addition, these modifications seem to have an impact on the guidelines for the 3-dimensional placement of implants when it comes to an optimization of the restorative result.

Indications for immediate anterior and posterior implant placement will be described briefly. Guidelines for the prosthodontically driven 3-dimensional implant placement will be discussed in detail for healed vs. immediate sites. Based on the latest literature the currently available clinical evidence particularly for immediate implant placement combined with immediate temporization will be thoroughly analyzed.

Clinical case presentations will finally document possibilities for success with this very rewarding yet risky treatment modality.
