

Piano di trattamento e sequenza della terapia nella riabilitazione implantare dei settori estetici

Treatment planning and sequence of therapy in anterior implant rehabilitation

Tidu Mankoo (London- UK)

XVIII International Congress SIdP – Saturday 18 March 2017

The aesthetic rehabilitation of failing teeth and the periodontally compromised dentition remains a challenge despite the numerous advances in the treatment of periodontitis, regenerative and dental implant therapies. These presentations will review the contemporary surgical and prosthetic concepts in management of implants in the aesthetic zone with a view to achieving optimum long term aesthetics and stability.

The outcomes depend on the clinical management and an understanding and application of the biological factors that influence our treatment outcomes. The optimal management of the interplay between bone, soft tissues and prosthetics determines the aesthetic outcome and the long-term stability of soft tissue aesthetics. An interdisciplinary approach is the key to success.

Participants will:-

- Learn the key principles for the treatment planning and management (both surgical & prosthetic) of failing teeth in the aesthetic zone
- Gain an understanding of the biology of the periodontal and peri-implant tissues and the application of this knowledge to clinical decision-making.
- Comprehend the behaviour of the bone & soft tissues around post-extraction sites and around dental implants
- Learn the principles of bone and soft tissue management around implants, as well as how to manage bone and soft tissue defects in post-extraction sites and peri-implant defects
- Learn to manage both delayed and immediate implants
- Be taught the keys to the management of single tooth and multiple tooth cases
- Learn the benefit of interdisciplinary case management
